Asus rt-ac66u admin page

Let's assume your public ip is 1.2.3.4 First, you have your router at 192.168.1.1 Its admin panel is running at port 80, so you can access it with "192.168.1.1:80" using your browser, or just "192.168.1.1" (because the browser will visit port 80 by default). From outside, you can access this by just doing "1.2.3.4:(80)". Now you have your web service running at 192.168.1.2 Its service also uses port 80, so you can access it with "192.168.1.2:80" From LAN, you can access both different services by doing "192.168.1.1" and "192.168.1.2". Your router probably automatically forwarded its own port 80 to the outside, so you can access it from outside by going to 1.2.3.4 by default. But your router is also just a device in your network. So when you entered a rule that says local ip = 192.168.1.2, local port = 80, port range = 80 This basically means 1.2.3.4:80 -> 192.168.1.2:80 Now you can enter a different rule local ip = 192.168.1.1, local port = 80, port range = 8080 This will make possible 1.2.3.4:8080 -> 192.168.1.1:80 You should follow these instructions to login to your ASUS Router.Connect the cable from the router to your computer. If you want, you can use your wireless network as an alternative option.Recommendation: If you are using an ASUS – RT-AC66U B1 router, we recommend using a wired connection. This eliminates the risk of suddenly losing your session while making settings changes.Now access your router's admin panel and fill in your router's default user name and password in the desired fields. If you do not know your username and password, we recommend that you try one of the default passwords for ASUS routers.ASUS Routers HelpIf you are having difficulty logging in to your router, you are probably entering the wrong username or password. After changing both, we recommend that you write them down so you don't have trouble remembering them.Login don't remember your password? You can resolve this issue by not resetting your router's login information. To reset your router, press the small black button on the back of your router for 10 seconds. This will restore your router to the factory settings.Router login page not loading? If the login page is not loading, make sure the device you are using is connected to the wi-fi. You will also need to check if the wrong router IP address is set as the default one.Users may experience problems with loading time on pages or failing to reach the speed they need to access. This is because your network uses a different IP address. In this case, you should check our IP address router list and find the correct address for you. If you need help, you should check out our article on how to find your router's IP address. Depending on your router's configuration, you might have to connect using a LAN port, and the client accessing the administration interface usually needs to be in the same IP range.For example, if you need to connect to in order to access the admin interface, your client PC needs to be in the range between 192.168.1.2 and 192.168.1.254.Also, you will most likely need a recent browser version with Javascript support.There are a number of other troubleshooting steps you can take, here is a list.Make sure you're using the correct IP address for the router, as well as the correct port (some use 443, or 8080 instead of the standard port 80). For a list of routers and their default IPs/passwords check our broadband hardware database.You can also often find your router's IP by simply typing: ipconfig in command prompt, and looking at the "Default Gateway" line.Your client PC must be on the LAN side of the router (connected to a LAN port). You might want to try configuring your PC with a static IP address in the router's subnet (the router's DHCP server might not be working/configured properly yet).Use a Cat5 cable to configure wireless routers - the wireless settings may not be configured correctly and wireless access to the admin interface may be disabled.Reboot the router - it is possible that the router is locked, the built-in web server has locked/crashed, and you can't connect to it because of a temporary software issue that a simple reboot may be able to solve.Reset the router to the factory defaults - NAT routers usually have a reset button, that when pressed for 10-30 seconds (while powering up/plugging in) resets the router to the factory defaults, so you can login with the default password, etc. Some may have a pinhole reset button that requires a sharp object like a paper pin to push. Just push in the button, then plug-in the device and wait for 10-30 seconds until the LED indicators show some change (they usually blink all together, in a different way than normal operation), then you can let go of the reset button. Note the procedure might be different for your particular router, check the user manual.Try a different web browser - some older routers don't like particular web browsers because of buggy/dated code. Try Chrome, Internet Explorer, etc.Disable web proxies - make sure Internet Explorer is not configured to use some type of web proxy for browsing.Update firmware - sometimes a corrupt firmware can render the router useless. Try updating to the newest one from the manufacturer's website if you can get to the admin interface.DHCP ? - NAT routers usually act as DHCP servers to serve multiple local IP addresses to internal LAN clients. If you set your network adapter to "Obtain an IP address automatically" in the TCP/IP properties and your PC gets an IP address it is communicating with the router. This can be verified by dropping to command prompt, and typing: ipconfig. If the IP address is in one of the private ranges, usually 192.168.x.x, or 10.0.x.x, (but not 169.*.*), then that indicates your client is able to obtain an IP from your router/DHCP server. You can also verify the IP address of your "Gateway" - that is the actual router IP you are connecting to.PING the router - In Command prompt, try: ping 192.168.0.1 (substitute with the actual IP of your router from above step). If it works, at least you know that you have some connectivity to it and the cable is good. If you are also able to ping an external IP, like 68.67.73.20, for example, it indicates you are online as well.Check cables and LEDs are you getting the link LEDs on both ends of all cables? You might also try different Cat5 cables. The router has a number of LED indicators as well, power, connectivity to the WAN port, etc. These can be used as indicators of whether the router is connected to the internet, LAN, etc.Telnet ? - some routers have a serial port where you can connect directly (using a serial cable) and manage the router's settings via telnet. Even though it's a text-based interface, it does not rely on the network/IPs at all.Note: If you are not sure of the default IP address, or username/password for your particular NAT router, you can look it up in our hardware database of over 3500+ routers. Your ASUS router login can be used to perform common setup tasks, secure your wireless network, and more. This guide will show you how to log into your ASUS router using the router's IP address and login credentials, including the default username and password. This page shows you how to login to the Asus RT-AC66U router. Other Asus RT-AC66U Guides Find Your Asus RT-AC66U Router IP Address We need to know the Internal IP Address of your Asus RT-AC66U router before we can login to it. Asus RT-AC66U IP Addresses 192.168.1.1 If you did not see your router's ip address in the list above. There are 2 additional ways that you can determine your router's IP address: You can either follow our How To Find Your Routers IP Address guide. Or you can use our free software called Router IP Address. Now that you have your router's Internal IP Address we are ready to login to it. Login to the Asus RT-AC66U Router The Asus RT-AC66U has a web interface for configuration. You can use any web browser you like to login to the Asus RT-AC66U. In this example we'll use Internet Explorer. Enter Asus RT-AC66U Internal IP Address Put the Internal IP Address of your Asus RT-AC66U in the Address Bar of your web browser. It looks like this: Then press the Enter key on your keyboard. You should see a dialog box pop up asking you for your Asus RT-AC66U username and password. Asus RT-AC66U Default Username and Password You need to know the username and password to login to your Asus RT-AC66U. All of the default usernames and passwords for the Asus RT-AC66U are listed below. Asus RT-AC66U UsernamesAsus RT-AC66U Passwords adminadmin Enter your username and password in the dialog box that pops up. It looks like this: Asus RT-AC66U Home Screen You should now see the Asus RT-AC66U Home Screen, which looks like this. If you see this screen, then congratulations, you are now logged in to your Asus RT-AC66U. You are now ready to follow one of our other guides. Solutions To Asus RT-AC66U Login Problems If you can not get logged in to your router, here a few possible solutions you can try. Asus RT-AC66U Password Doesn't Work You should try other Asus passwords. We have a large list of Asus Passwords that you can try located here. Perhaps your router's default password is different than what we have listed here. Forgot Password to Asus RT-AC66U Router If your Internet Service Provider supplied you with your router then you might want to try giving them a call and see if they either know what your router's username and password are, or maybe they can reset it for you. How to Reset the Asus RT-AC66U Router To Default Settings If you still can not get logged in then you are probably going to have to reset your router to its default settings. You may want to follow our guide called How To Reset your Router. Other Asus RT-AC66U Guides Here are some of our other Asus RT-AC66U info that you might be interested in.
